

~ 247 features

↳ almost 3 million samples

↳ features are highly correlated

e.g. GC content locus $n-1$ &
GC content locus $n-2$

↳ dimensionality reduction is needed

↳ PCA (standardize features!)

↳ SVD (standardize features?)

↳ UMAP (standardize features?)

↳ tSNE (standardize features?)

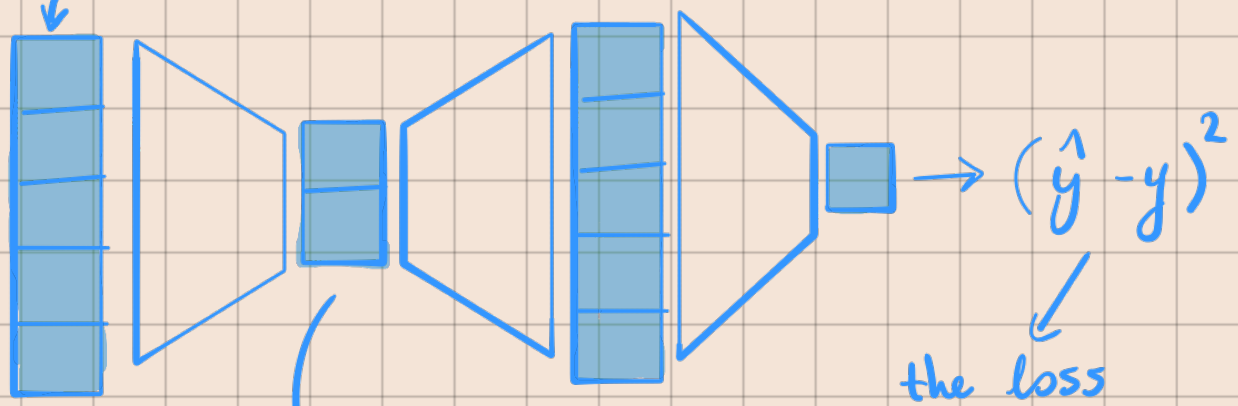

↳ AE

↳ predictive AE:

↳ DL approach makes sense
because we have $N \gg P$

↳ AE can extract embeddings
that are meaningful for
prediction

original features

extract this
embedding (as input to the
linear model)

↳ standard AE (also by that)
